

ABSTRACT

A holster, to be worn around the waist of a user, and capable of containing at least one heated object, for instance a stone, and at least one receptacle containing a fluid. The holster includes a thermally insulated portion and a thermally open portion, removable storage lining portions and a securing means for securing the holster to the waist of a user. The present invention allows a massage therapist or the like to regulate the temperature of a heated object, such as a stone, at an ideal temperature for application in their trade and to gain easy access to necessary liquids.
